SCOPE

The aim of Indonesian Journal of Electrical Engineering and Computer Science (formerly TELKOMNIKA Indonesian Journal of Electrical Engineering) is to publish high-quality articles dedicated to all aspects of the latest outstanding developments in the field of electrical engineering. Its scope encompasses the applications of Telecommunication and Information Technology, Applied Computing and Computer, Instrumentation and Control, Electrical (Power), Electronics Engineering and Informatics which covers, but not limited to, the following scope: Signal Processing[...] Electronics[...] Electrical[...] Telecommunication[...] Instrumentation & Control[...] Computing and Informatics[...]

Varsha 7 months ago

Dear Elena Corera,
I found the Indonesian Journal of Electrical Engineering and Computer Science journal on <https://www.scopus.com/sources.uri> website . So please make it clear whether it is scopus indexed or not?

← reply

Melanie Ortiz 7 months ago

Dear Varsha,
Thank you very much for your comment.
All the metadata have been provided by Scopus /Elsevier in their last update sent to SCImago, including the Coverage's period data. The SJR for 2020 was released on 17 May 2021. We suggest you consult the Scopus database directly to see the current index status as SJR is a static image of Scopus, which is changing every day.

INFORMATION

- For Readers
- For Authors
- For Librarians

The criteria for acceptance of manuscripts are the quality of work. This will concretely be reflected in the following aspects: novelty & practical impact; technical soundness; appropriateness and adequacy of: literature review, background discussion & analysis of issues; and presentation (overall organization, English & readability). For a contribution to be acceptable for publication, these points should be at least in the middle level.

Authors should submit only papers that have been carefully proofread and polished to avoid having to re-work the manuscript later in the review process. Authors should present their work honestly without fabrication, falsification, plagiarism or inappropriate data manipulation. Manuscripts are accepted with the understanding that they are original or extended versions of previously published papers in conferences and/or journals and that, if the work received an official sponsorship, it has been duly released for open publication. Before submission please make sure that your paper is prepared using the journal paper template. It is available as word and latex version, kindly please [download the Journal template \(MS Word\)](#) or [LATEX version](#). This will ensure fast processing and publication. Any papers not fulfilling the requirements based on the guideline to authors will not be processed.

Reasons to publish (Authors benefits) for publication their paper in this journal:

1. **Open access:** all research articles published in this journal are open access and immediately accessible online to the entire global research community. Our open access policy ensures high visibility and maximum exposure for your work-anyone with online access can read your article.
2. **High citation:** This journal has high citation, so you are easy for increasing your H-index. Please click [in here](#) to find citation counts for this journal.
3. **Rapid publication:** Online submission, electronic peer review and production make the process of publishing your article simple and efficient.
4. **Quality, reputation and high standard of peer review:** This journal has a high standard of peer review. Each editor and reviewer conducts the evaluation of manuscripts objectively and fairly.
5. **Included in all major bibliographic databases:** All articles published in this journal are included in many bibliographic databases so that your work can be found easily and cited by researchers around the world.

Please do not hesitate to contact us if you require any further information at email: ijeecs.iaes@gmail.com, ijeecs@iaescore.com

Announcements

Does not accept any papers suggestion from conference organizers

Dear Sir/Madam,

Due to huge regular papers submission, we apologize that our journal does not accept any papers suggestion from other conference organizers.

Your attention and cooperation is very highly appreciated.

Best Regards,
IJECS Editorial Office

Posted: 2020-06-01

ABSTRACT

This paper aims to determine the efficiency in classifying and recognizing Thai digit handwritten using convolutional neural networks (CNN). We created a new dataset called the Thai digit dataset. The performance test was divided into two parts: the first part determines the exact number of epochs, and the second part examines the occurrence of overfits in the model with Keras library's EarlyStopping() function, processed through Cloud Computing with Google Colaboratory, and used a Python programming language. The main parameters for the model were a dropout of 0.75, mini-batch size of 128, the learning rate of 0.0001, and using an Adam optimizer. This study found the model's predictive accuracy was 96.88 and the loss was 0.1075. The results showed that using CNN in image classification and recognition. It has a high level of prediction efficiency. However, the parameters in the model must be adjusted accordingly.

1. INTRODUCTION

In the information age, there is a lot of information that exists in the digital world and it was created by human hands and then imported into the computer such as handwritten text images, human handwritten text. When imported to a computer it can make machines distinguish who's handwriting. Handwriting is a movement directed from the brain, possibly unknowingly occurring at the time of writing [1]. Recognition of human handwriting it is increasingly important in the digital age because it is used in activities such as banking, mail sorting tasks. In the past, it was believed that machines could not process complex tasks. But at present, machines can process complex tasks more easily and with high accuracy [2]. In recent times, different systems have been developed or classified. It is intended to be used in various fields that require high efficiency in classifying or memorizing [3]. Research on human writing or handwriting recognition is challenging because each person has different writing styles, even in the same letter [4]. The human brain allows humans to interpret any different handwritten letters and numbers through the neural network within the brain. This allows us to learn complex new things. There is a wide variety of research that applies the neural network to simulate the human brain for reading handwriting in easier ways [5]. Handwriting recognition is an issue that is still being studied. Handwriting is easy to remember because there are many different things, such as different font styles and the writing styles of each person. Handwriting identity identification is very useful. Examples of applying to banking applications, such as handwriting recognition to confirm receipt of money or when paying [6]. A system capable of recognizing and classifying handwritten objects helps prevent complex problems [5]. This has resulted in the development of applications and algorithms that can better examine and analyze the semantics of handwritten images [3]. There are many

algorithms used for searching, comparing, classifying, and recognizing image data. A popular algorithm for image classification is the machine learning algorithm and deep learning [7]. Deep learning is a subset of machine learning. The architecture of deep learning has several layers stacked inside and nonlinear processing deep learning can make decisions about new information by learning from a given dataset, through the neural network. Deep learning is efficient in processing large image data with high accuracy, so it is often used for image classification, image and video processing, speech recognition, text prediction, handwriting, and more [8]–[13]. One of the popular deep learning techniques for categorizing images is convolutional neural networks.

In this paper, the purpose of developing a model for classifying Thai digit handwritten using convolutional neural networks. Thai digits were invented for use during the reign of King Ramkhamhaeng the Great. Which has been 738 years. The origin of Thai digits comes from the Devanagari script of India, as well as Arabic digits. It is currently used in Thailand's government offices. Examples of Arabic digits versus Thai digits as shown in Figure 1.

Arabic digit	0	1	2	3	4	5	6	7	8	9
Thai digit	๐	๑	๒	๓	๔	๕	๖	๗	๘	๙

Figure 1. Arabic digits vs Thai digits

2. RESEARCH METHOD

2.1. Convolutional neural network (CNN)

CNN is one of the most popular deep learning methods used for recognizing and classifying images and belongs to the supervised learning category [14], [15]. CNN is a feed forward neural network inspired by biology [16], [17]. A CNN consists of neurons or filters with weights and biases that are used to train the model to extract image properties. A CNN consists of two parts; feature extraction and classification [18]. The basic architecture of CNN is shown in Figure 2. It consists of the input layer, convolution layer, pooling layer, and fully connected layer. In the convolution layer and pooling layer, there can be more than one and send the data to the fully connected layer [14], [19].

Figure 2. The basic architecture of convolutional neural network [13]

An example of a convolutional is shown in Figure 3. Let's start by multiplying the input with a feature detector or filter or a kernel that's smaller than the input let's multiply element-wise. When you're done multiplying, move the kernel all the way to the right [12]. Then add all the results together and get the result in the feature map field. Then repeat all input data. You must specify the sliding windows to extract the feature.

An example of max pooling is shown in Figure 4. The max pooling process reduces the number of output parameters that the network must learn [20]. The size of the filter must be determined and then find the maximum value in the area where the filter is defined.

From Figure 3 convolutional operation, there's a 4x4 input image and a feature detector 3x3. The first 3x3 input metric is multiplied element-wise by the feature detector. Then add the results for each value and put it in the first box of the feature map. In the figure, it's equal to 2. From Figure 4 is to find the Max Pooling, set the pooling size equal to 2x2, and put the largest value in the pooled feature map.

Figure 3. Convolutinal operation

Figure 4. Max pooling

2.2. Model evaluation

In the model evaluation phase, the confusion matrix was used to verify the accuracy of the prediction and other minor discrepancies. Confusion matrix is used to show the performance of a trained model. The values obtained from the confusion matrix are accuracy, precision, recall, and F1-score. The confusion matrix is a table that describes the ability to predict actual vs. machine learning predictions. It describes the number of true positives (TP), false positives (FP), true negatives (TN), and false negatives (FN), it has the following meanings: TP is what the program predicts is "true" and is "true", TN is what the program predicts is "not true" and has a value "not true", FP is what the program predicts is "true" but is "false", FN is what the program predicts is "not true" but is "true". The formula for calculating values, accuracy, precision, recall, and F1-score shown in the (1)-(4) [21], [22].

$$Accuracy = \frac{(TP+TN)}{(TP+FP+FN+TN)} \quad (1)$$

$$Precision = \frac{TP}{(TP+FP)} \quad (2)$$

$$Recall = \frac{TP}{(TP+FN)} \quad (3)$$

$$F1\ Score = \frac{2*(Recall*Precision)}{(Recall+Precision)} \quad (4)$$

2.3. Data preparation

In this operation, it started by collecting handwritten Thai digits from a sample of 200 people, comprising students, citizens, and personnel from the public and private sectors, and writing Thai digits on the given form as shown in Figure 5. After that, scan the image from the form as a pdf file and crop the image into a single digit as a 28x28 pixels, as shown in Figure 6. By randomly selecting from a total of 14,950 images, it's called the Thai digit dataset. By randomly selecting images from a sample of 14,950 images called the Thai digit dataset. The Thai digit dataset is divided into 10 classes, which are digits ๐-๙ (0-9); each class has 1495 images. After that, the data is divided into two parts: the training dataset of 1,046 images and the testing dataset of 449 images, which is equal to the ratio of 70:30.

Figure 5. Thai digit handwritten form

Figure 6. Example of thai digit dataset

2.4. Model creation

The CNN model is based on the Python programming language and the Keras library. Cloud computing with Google Colaboratory is a cloud service based on Jupyter Notebooks used for machine learning education and research. Runtime is configured for deep learning and access to powerful GPU for free [23]. The structure of the CNN model in this section, generated with the Keras context, is shown in Table 1.

Table 1. Summary of CNN model structure

Layer (type)	Output shape	Param #
Input	(None, 28, 28, 3)	1568
conv2d (Conv2D)	(None, 25, 25, 32)	1568
max_pooling2d (MaxPooling2D)	(None, 12, 12, 32)	0
dropout (Dropout)	(None, 12, 12, 32)	0
conv2d_1 (Conv2D)	(None, 9, 9, 64)	32832
max_pooling2d_1 (MaxPooling2D)	(None, 4, 4, 64)	0
flatten (Flatten)	(None, 1024)	0
dense (Dense)	(None, 1024)	1049600
dense_1 (Dense)	(None, 10)	10250

From Table 1, the structure of the model consists of an Input layer, two layers of convolutional (Conv2D) and pooling (MaxPooling2D) and a dropout in the middle. Dropout is a regularization technique for deep learning [24] and uses the activation function as rectified linear unit (ReLU). After that, multidimensional data is transformed into vectors with flatten layer and fully connected in dense layer, which is a hidden layer in a neural network. In the last dens layer, we use activation function as Softmax because our output is multi-class. It can be written as a schematic showing the structure of the model as shown in Figure 5.

In Figure 7 model structure Thai digit classification of CNN, input image (RGB color) size $28 \times 28 \times 3$ to convolutional will get output shape or feature map size $25 \times 25 \times 32$, and when doing the max pooling process, it'll get an output shape is $12 \times 12 \times 32$ which is halved from the convolutional process. After this layer, a dropout was applied with a probability of 75%. After that, it goes through the convolutional and max pooling processes again. It'll get output to shape sizes $9 \times 9 \times 64$ and $4 \times 4 \times 64$, respectively, and convert multidimensional data to one dimension in a flatten layer. Finally, set a dense layer with 10 classes of output.

Figure 7. Model structure thai digit classification of CNN

2.5. Model training

Model Training is a process that teaches the machine to learn from the data prepared from the data preparation phase. The training of the model is divided into two parts to find the efficiency of the model. Considering the highest accuracy and the lowest loss, set the values for each part as follows:

- Part 1 determines the exact number of epochs to train the model, without checking for overfitting in the model. The epoch values for the model training were 100, 200, 300, ..., 1000 and the dropout equal 0.75; the mini-batch size equal 128; the learning rate equal 0.0001, and using an Adam optimizer, this is an algorithm for optimizing model training, resulting in reducing training and validation loss [25], [26]. The results for each epoch are shown in Figure 8.
- Part 2 sets the maximum number of epochs equal to 1000 and monitors the model overfit, allowing the training process to stop before the maximum epoch value when the validation data loss value is greater than or equal to the previous loss minimum [27]. This technique keeps the model from overfitting by using callbacks from Keras EarlyStopping() function. Train the model three times. Each time it assigns a

value to the patience variables of 10, 20, and 30, and other variables defined same as Part 1. The model training results are shown in Table 2 and Figure 9.

3. RESULTS AND DISCUSSION

The results of the model training with a Thai digit handwritten dataset using CNN, the objective is to find the best performance of the model. The results of the model training are divided into two parts.

- a) Part 1 the results of the model performance evaluation. The accuracy and loss in the prediction of each epoch appear as shown in Figure 8.

From Figure 8(a) and (b), the model performance evaluation results. The predictive accuracy increased until the epoch was 400 with an accuracy equal to 96.93. After that, the accuracy began to drop significantly and it has a maximum accuracy of epoch 900, which has an accuracy equal to 96.97%. Considering the model's Loss, the Loss dropped to an epoch of 400. After that, there is an increasing trend. In conclusion, an epoch of 400 is best for training a model with a fixed number of epochs because it has high accuracy and low loss. If the epoch increases, the more time it takes to train the model.

- b) Part 2 sets the maximum epoch equal to 1,000 and checks the model overfit with Keras library's EarlyStopping() function. The highest accuracy and the lowest loss, where patience is 30; accuracy is 96.88, and loss is 0.1075. It has fewer epochs compared to the patience of 20, which has more accuracy and loss. The results are shown in Table 2 and the accuracy and loss can compared as shown in Figure 9(a) and (b).

From the results of the experiment in Part 2, the predictive efficiency of the model was the best. When the patience parameter was set to 30, the time spent training and testing the model was 45 minutes, with the highest accuracy equal to 96.88 and the least loss equal to 0.1075. This is consistent with research by [21] using a convolutional neural network (CNN) to classify brain tumor images. Using magnetic resonance imaging (MRI), the model's efficacy was 96.1% accurate, and [28] research was conducted on gender classification using custom convolutional neural networks architecture. Provides a classification accuracy of not less than 96%, and [29]–[33] found that the accuracy was between 90%–98%.

The details of the confusion matrix are shown in Figure 10. Classification errors are caused by the similarity of the shapes and the characteristics of writing Thai Digit. The results of the evaluation of precision, recall, and F1-score for each class are shown in Table 3.

Figure 8. Result of model evaluation (a) accuracy and (b) loss

Table 2. Results of model training

Patience	Epoch	Time (min)	Accuracy	Loss
10	156	30	96.46	0.1172
20	224	49	96.39	0.1235
30	209	45	96.88	0.1075

Table 3. Best Results of precision, recall, and F1-score

Class	Precision	Recall	F1-Score
๐ (0)	94%	98%	96%
๑ (1)	96%	93%	95%
๒ (2)	98%	93%	96%
๓ (3)	99%	100%	99%
๔ (4)	96%	95%	95%
๕ (5)	94%	94%	94%
๖ (6)	96%	99%	97%
๗ (7)	99%	97%	98%
๘ (8)	98%	99%	98%
๙ (9)	100%	99%	99%

4. CONCLUSION

We have created a new Thai digit dataset. Starting from creating a form for writing Thai digits, then crop into single digits and randomly select all 14,950 images, size 28x28 pixels, divided into 10 classes (0-9); each class has 1495 images. After that, the data were divided into 1046 training sets and 449 test sets, representing a ratio of 70:30. The process of training and testing the best performing model. We assign values to the following parameters: dropout equal 0.75, the mini-batch size equal 128, the learning rate equal 0.0001, using an Adam optimizer, and checking the model overfit with Keras library's EarlyStopping() function, and set patience parameter was set to 30. After setting the values, it shows an accuracy of 96.88 and

a loss of 0.1075, which is the best. Therefore, it can be concluded that in creating a model to classify images of Thai digit handwritten with Convolution Neural Network, the prediction accuracy is high and the loss is low, which is similar to other researchers. For future work, it is advisable to experiment with modifying additional parameters to suit the desired task in order to increase the predictive performance of the model to be more accurate.

ACKNOWLEDGEMENTS

This research was accomplished with great assistance from many students, staff, and faculty who provided assistance in handwriting in order to provide information for processing. Thank you Research and Development Institute Phetchabun Rajabhat University that has funded this research.

7. Paragraph

A paragraph is a sentence or group of sentences that support one main idea. Many authors have presented paragraphs in very long terms. Author should use simple sentences which are grammatically correct, but too many can make your writing less interesting.

Every paragraph in a paper should be:

- Unified: All of the sentences in a single paragraph should be related to a single controlling idea (often expressed in the topic sentence of the paragraph).
- Clear: The sentences should all refer to the central idea of the paper.
- Coherent: The sentences should be arranged in a logical manner and should follow a definite plan for development.
- Well-developed: Every idea discussed in the paragraph should be adequately explained and supported through evidence and details that work together to explain the paragraph's controlling idea.

2022-02-04 04:11 AM The following message is being delivered on behalf of Indonesian Journal of Electrical Engineering and Computer Science.

Dear IJEECS Editor.

We have now updated the articles as instructed. The content is updated and referenced in the table below, and the manuscript has been submitted electronically. I hope we will receive good news from the journal.

Best Regards.

Asst. Prof. Kheamparit Khunratchasana

Indonesian Journal of Electrical Engineering and Computer Science

Editor Subject: [IJEECS] Editor Decision "Thai Digit Handwriting Image Classification with Convolution Neuron Networks"

[DELETE](#)

2022-02-10 07:12 AM The following message is being delivered on behalf of Indonesian Journal of Electrical Engineering and Computer Science.

-- Paper ID# 26466
 -- Please adhere to every detail of the guide of authors <http://iaescore.com/gfa/ijeecs.docx>.
 -- The minimum number of references is 25 references (for original research)
 -- and 50 references (for review/survey paper), primarily to recent journal articles.
 -- Please attach your similarity report checking that the result is below 25% using software such as iThenticate or Turnitin.

=====

Dear Prof/Dr/Mr/Mrs: Kheamparit Khunratchasana,

It is my great pleasure to inform you that your paper entitled "Thai Digit Handwriting Image Classification with Convolution Neuron Networks" is ACCEPTED and will be PUBLISHED on the Indonesian Journal of Electrical Engineering and Computer Science, a Scopus indexed journal (CiteScore 2018: 0.97, SNIP 2018: 0.724, SJR 2018: 0.238, Q3 on Electrical and Electronic Engineering, Q3 on Computer Networks and Communications, Q3 on Hardware and Architecture, Q3 on Signal Processing, and Q3 on Control and Optimization). Congratulations!

Your paper will be scheduled after your final paper, similarity report and payment evidence reached us !!!
 Please submit your final paper (in MS Word file format, or LaTeX source files) along with your similarity report and your payment evidence within 6 weeks to email: IJEECS.iaes@gmail.com. The similarity rate should be checked by using software such as iThenticate or Turnitin (that the result is less than 25%). If the similarity index is more than 25%, your paper will be rescheduled for publication until the similarity is less than 25%.

URGENT!! Pay attention to the following instructions carefully! YOU MUST DO!!

1). PLEASE ADHERE STRICTLY THE GUIDE OF AUTHORS <http://iaescore.com/gfa/ijeecs.docx> (Use this file as your paper template!!) and pay attention to the checklist for preparing your FINAL paper for publication: <http://ijeecs.iaescore.com/index.php/IJEECS/about/editorialPolicies#custom-3>

2). It is mandatory to present your final paper according to "IMRAD style" format, i.e.:

1. INTRODUCTION
2. The Proposed Method/Algorithm/Procedure specifically designed (optional)
3. METHOD
4. RESULTS AND DISCUSSION
5. CONCLUSION

See <http://iaescore.com/gfa/ijeecs.docx>

3). Add biographies of authors as our template (include links to the 4 authors' profiles, do not delete any icons in the template).

--> Provide links for all authors to the 4 icons (Scholar, Scopus, Publons and ORCID). It is mandatory!! See <http://iaescore.com/gfa/ijeecs.docx>

4). Prepare all tables as our template (NOT as figure)

5). Use different PATTERNS for presenting different results in your figures/graphics (instead of different colors). It is mandatory!! See <http://iaescore.com/gfa/ijeecs.docx>

6). Please ensure that all references have been cited in your text. Use a tool such as EndNote, Mendeley, or Zotero for reference management and formatting, and choose IEEE style. Each citation should be written in the order of appearance in the text in square brackets. For example, the first citation [1], the second citation [2], and the third and fourth citations [3], [4]. When citing multiple sources at once, the preferred method is to list each number separately, in its own brackets, using a comma or dash between numbers, as such: [1], [3], [5]. It is not necessary to mention an author's name, pages used, or date of publication in the in-text citation. Instead, refer to the source with a number in a square bracket, e.g. [9], that will then correspond to the full citation in your reference list.

Examples of in-text citations:

This theory was first put forward in 1970 [9].

Zadeh [10] has argued that ...

Several recent studies [7], [9], [11]-[15] have suggested that....

... end of the line for my research [16].

7). Please present all references as complete as possible and use IEEE style (include information of DOIs, volume, number, pages, etc). If it is available, DOI information is mandatory!! See <http://iaescore.com/gfa/ijeecs.docx>

Please prepare your final paper by doing your best to avoid any delay for publication !!!

We really appreciate your total commitment to supporting this journal.

Best Regards,
T. Sutikno

Please also pay an attention to double check your final camera ready paper:

(1) Introduction section: explain the context of the study and state the precise objective. Introduction section should be presented in 3-6 paragraphs. An Introduction should cover the following three (3) parts:

- Background: Authors have to make clear what the context is. Ideally, authors should give an idea of the state-of-the-art of the field the report is about.
- The Problem: If there was no problem, there would be no reason for writing a manuscript, and definitely no reason for reading it. So, please tell readers why they should proceed reading. Experience shows that for this part a few lines are often sufficient.
- The Proposed Solution: Now and only now! - authors may outline the contribution of the manuscript. Here authors have to make sure readers point out what are the novel aspects of authors' work. Authors should place the paper in proper context by citing relevant papers. At least 10 references (recent journal articles) are referenced to support this section.

(2) Conclusion section: Summarize sentences the primary outcomes of the study in a paragraph. Are the claims in this section supported by the results, do they seem reasonable? Have the authors indicated how the results relate to expectations and to earlier research? Does the article support or contradict previous theories? Does the conclusion explain how the research has moved the body of scientific knowledge forward?

(3) About Figures & Tables in your manuscript:

- Because tables and figures supplement the text, all tables and figures should be REFERRED in the text. Authors MUST EXPLAIN what the reader should look for when using the table or figure. Focus only on the important points the reader should draw from them, and leave the details for the reader to examine on her own.
- Tables are to be presented with a single horizontal line under: the table caption, the column headings and at the end of the table. All tables are produced by creating tables in MS Word. Captured tables are NOT allowed.
- All figures MUST in high quality images

(4) Please ensure the maximum page of your final paper is 8-pages for normal publication fee, but still allow up to 12 pages (required to pay an extra fee after 8 pages, USD50 per page).
