SCOPE

Owned by King Fahd University of Petroleum and Minerals, AJM publishes carefully refereed research papers in all main-stream branches of pure and applied mathematics. Survey papers may be submitted for publication by invitation only. To be published in AJM, a paper should be a significant contribution to the mathematics literature, well-written, and of interest to a wide audience.

A Novel Accelerated Extragradient Algorithm to Solve Pseudomonotone Variational Inequalities

Arabian Journal of Mathematics

Dear Dr. Pakkaranang,

It is my pleasure, on behalf of the Editorial Board, to inform you that your paper AJOM-D-21-00049R2 has been accepted for publication in Arabian Journal of Mathematics and is expected to appear in one of the forthcoming regular issues.

In due course, you will receive proofs of your article for correction.

Thank you for submitting your work to Arabian Journal of Mathematics.

Sincerely yours,

Mr. Edward Nolasco Jr.

Assistant Editor

Arabian Journal of Mathematics

COMMENTS TO THE AUTHOR:

Algorithm 1 Iterative Stochastic Convergence Results Method

Step 0: Select $\alpha_0 \in \mathbb{R}$, $\alpha \in \mathbb{R}$, $\alpha = 0$ and $0 = \alpha_0 = \alpha + \frac{1}{2} = \frac{1}{2}$. Moreover, choose $\{a_k\}_k \subset \mathbb{R}$, $\{1\}$ satisfying the conditions:

$$\lim_{k \rightarrow \infty} a_k = 0 \text{ and } \sum_{k=0}^{\infty} a_k = +\infty.$$

Step 1: Compute

$$f_k = \alpha_k + \alpha(a_k - \alpha_{k-1}) - \alpha_k \left[\alpha_k + \alpha(a_k - \alpha_{k-1}) \right],$$

where α_k such that

$$0 \leq \alpha_k \leq a_k \text{ and } \alpha_k = \begin{cases} \min \left\{ \alpha_k, \frac{\alpha(a_k - \alpha_{k-1})}{a_k} \right\} & \text{if } \alpha_k \neq \alpha_{k-1} \\ 0 & \text{else,} \end{cases}$$

where $\alpha_k = \alpha(a_k)$ is a positive sequence, i.e., $\lim_{k \rightarrow \infty} \alpha_k = 0$.

Step 2: Compute

$$f_k = P_{\mathcal{C}}(f_k), \quad \alpha_k = P_{\mathcal{C}}(\alpha_k),$$

If $\alpha_k = \alpha_{k-1}$, then STOP and α_k is a solution. Otherwise, go to next step.

Step 3: Compute

$$\alpha_{k+1} = P_{\mathcal{C}}(\alpha_k + a_k), \quad \alpha_{k+1} = P_{\mathcal{C}}(\alpha_k + a_k).$$

A novel accelerated extragradient algorithm to solve pseudomonotone variational inequalities

Received: 1 February 2021 / Accepted: 31 August 2022
© The Author(s) 2022

Abstract In this paper, we propose a new inertial iterative method to solve classical variational inequalities with pseudomonotone and Lipschitz continuous operators in the setting of a real Hilbert space. The proposed iterative scheme is basically analogous to the extragradient method used to solve the problems of variational inequalities in real Hilbert spaces. The strong convergence of the proposed algorithm is set up with the prior knowledge of Lipschitz's constant of an operator. Finally, several computational experiments are listed to show the applicability and efficiency of the proposed algorithm.

1 Introduction

This article studies the iterative method that is used to estimate the solution of *variational inequality problem* (shortly, **VIP**) in the setting of a real Hilbert space. Let $\mathcal{X}$ be a real Hilbert space and $\mathcal{D}$ be a non-empty, closed, and convex subset of $\mathcal{X}$. Let $\mathcal{S} : \mathcal{X} \rightarrow \mathcal{X}$ to be an operator. The problem (**VIP**) for $\mathcal{S}$ on $\mathcal{D}$ is given as follows [15, 22]:

$$\text{Find } u^* \in \mathcal{D} \text{ such that } \langle \mathcal{S}(u^*), y - u^* \rangle \geq 0, \quad \forall y \in \mathcal{D}. \quad (\text{VIP})$$

Let us consider that Π is the solution set of the problem (**VIP**). This idea of variational inequalities includes different disciplines such as partial differential equations, optimization, optimal control, mechanics, mathematical programming, and finance (see [6, 11–14, 18, 24]). This problem is an important topic in the physical

sciences, and a considerable amount of discussion has been given to many authors who have dedicated themselves to studying not only the theory of existence and the stability of solutions but also the iterative method used to solve the problem.

Korpelevich [16] and Antipin [2] have established the following extragradient method. Their method consists of the following: Let $u_0 \in \mathcal{D}$ and $0 < \tau < \frac{1}{L}$ such that

$$\begin{cases} y_n = P_{\mathcal{D}}[u_n - \tau S(u_n)], \\ u_{n+1} = P_{\mathcal{D}}[u_n - \tau S(y_n)]. \end{cases} \quad (1)$$

On the other hand, many projection methods are used to figure out the numerical solution of variational inequalities. Many researchers have suggested various forms of projection techniques to solve the problem (VIP) (see for details [10, 16, 19, 25, 26, 28–32, 34, 36]). Almost all the methods for solving the problem (VIP) are based on the projection method, which is computed on the feasible set $\mathcal{D}$. It is important to note that the above well-established method has two significant flaws, the first being the fixed constant step size, which involves the knowledge or approximation of the Lipschitz constant of the respective operator and is only weakly convergent in the Hilbert spaces. From the computational point of view, it might be problematic to use a fixed step size, and hence the convergence rate and appropriateness of the method could be affected.

The main contribution of this study is to develop an inertial-type method used to improve the convergence rate of the sequence. Previously, such approaches have been developed based on the oscillator equation with damping and conservative force restoration. This second-order dynamical structure is called a strong friction ball and was originally studied by Polyak in [20]. Primarily, the functionality of the inertial-type method is that it will use the two prior iterations to execute the next iteration.

Therefore, a natural question is raised:

“Is it possible to introduce new strongly convergent inertial extragradient-like method to solve the problem (VIP)”?

In this study, we give a positive answer to the above question, i.e., the gradient method indeed generates a strongly convergent iterative sequence by letting a fixed and variable step size rule. In this paper, we study a different method to obtain strong convergence and introduce a new iterative method for solving variational inequalities involving pseudomonotone and the Lipschitz operator in a real Hilbert space. Our method is inspired by one projection method [16] and the inertial technique in [20]. At each iteration, the method only needs to compute one projection onto the feasible set. Under some suitable conditions imposed on control parameters, the iterative sequences generated by our method converge strongly to some solution of the considered problem. We also provide numerical examples to illustrate the computational effectiveness of the new method over some existing methods.

The paper is organized in the following way. In Sect. 2, we review some concepts and preliminary results used in the paper. Section 3 deals with the description of the method and proves its convergence theorems. Finally, Sect. 4 presents some numerical results to illustrate the convergence and effectiveness of the proposed method.

2 Background

In this section of the manuscript, we have written a number of important identities and relevant lemmas and definitions.

For all $u, y \in \mathcal{X}$, we have

$$\|u + y\|^2 = \|u\|^2 + 2\langle u, y \rangle + \|y\|^2.$$

A metric projection $P_{\mathcal{D}}(y_1)$ of $y_1 \in \mathcal{X}$ is defined by

$$P_{\mathcal{D}}(y_1) = \arg \min\{\|y_1 - y_2\| : y_2 \in \mathcal{D}\}.$$

First, we list some of the important features of projection operator.

Lemma 2.1 [3] *Suppose that $P_{\mathcal{D}} : \mathcal{X} \rightarrow \mathcal{D}$ is a metric projection. Then, the following conditions were satisfied.*

(i) $y_3 = P_{\mathcal{D}}(y_1)$ if and only if

$$\langle y_1 - y_3, y_2 - y_3 \rangle \leq 0, \quad \forall y_2 \in \mathcal{D}.$$

(ii)

$$\|y_1 - P_{\mathcal{D}}(y_2)\|^2 + \|P_{\mathcal{D}}(y_2) - y_2\|^2 \leq \|y_1 - y_2\|^2, \quad y_1 \in \mathcal{D}, y_2 \in \mathcal{X}.$$

(iii)

$$\|y_1 - P_{\mathcal{D}}(y_1)\| \leq \|y_1 - y_2\|, \quad y_2 \in \mathcal{D}, y_1 \in \mathcal{X}.$$

Lemma 2.2 [35] Assume that $\{p_n\} \subset [0, +\infty)$ is a sequence satisfies the following inequality:

$$p_{n+1} \leq (1 - q_n)p_n + q_nr_n, \quad \forall n \in \mathbb{N}.$$

Furthermore, $\{q_n\} \subset (0, 1)$ and $\{r_n\} \subset \mathbb{R}$ be two sequences such that

$$\lim_{n \rightarrow +\infty} q_n = 0, \quad \sum_{n=1}^{+\infty} q_n = +\infty \quad \text{and} \quad \limsup_{n \rightarrow +\infty} r_n \leq 0.$$

Then, $\lim_{n \rightarrow +\infty} p_n = 0$.

Lemma 2.3 [17] Assume that $\{p_n\}$ is a sequence of real numbers such that there exists a subsequence $\{n_i\}$ of $\{n\}$ such that

$$p_{n_i} < p_{n_{i+1}} \quad \forall i \in \mathbb{N}.$$

Then, there is a non decreasing sequence $m_k \subset \mathbb{N}$ such that $m_k \rightarrow +\infty$ as $k \rightarrow +\infty$, and meet the following requirements for numbers $k \in \mathbb{N}$:

$$p_{m_k} \leq p_{m_{k+1}} \quad \text{and} \quad p_k \leq p_{m_{k+1}}.$$

Indeed, $m_k = \max\{j \leq k : p_j \leq p_{j+1}\}$.

Next, we list some of the important identities that were used to prove the convergence analysis.

Lemma 2.4 [3] For any $y_1, y_2 \in \mathcal{X}$ and $\ell \in \mathbb{R}$. Then, the following inequalities hold:

(i)

$$\|\ell y_1 + (1 - \ell)y_2\|^2 = \ell\|y_1\|^2 + (1 - \ell)\|y_2\|^2 - \ell(1 - \ell)\|y_1 - y_2\|^2.$$

(ii)

$$\|y_1 + y_2\|^2 \leq \|y_1\|^2 + 2\langle y_2, y_1 + y_2 \rangle.$$

Lemma 2.5 [23] Assume that $S : \mathcal{D} \rightarrow \mathcal{X}$ is a pseudomonotone and continuous operator. Then, u^* is a solution to the problem (VIP) if and only if u^* is a solution to the following problem:

$$\text{Find } u \in \mathcal{D} \text{ such that } \langle S(y), y - u \rangle \geq 0, \quad \forall y \in \mathcal{D}.$$

Algorithm 1 (Inertial Strongly Convergent Iterative Method)

Step 0: Select $u_0, u_1 \in \mathcal{D}$, $\alpha > 0$ and $0 < \tau < \frac{1}{L}$. Moreover, choose $\{\psi_n\} \subset (0, 1)$ satisfies the following conditions:

$$\lim_{n \rightarrow +\infty} \psi_n = 0 \text{ and } \sum_{n=1}^{+\infty} \psi_n = +\infty.$$

Step 1: Compute

$$t_n = u_n + \alpha_n(u_n - u_{n-1}) - \psi_n[u_n + \alpha_n(u_n - u_{n-1})],$$

where α_n such that

$$0 \leq \alpha_n \leq \hat{\alpha}_n \text{ and } \hat{\alpha}_n = \begin{cases} \min \left\{ \frac{\alpha}{2}, \frac{\epsilon_n}{\|u_n - u_{n-1}\|} \right\} & \text{if } u_n \neq u_{n-1}, \\ \frac{\alpha}{2} & \text{else,} \end{cases} \quad (2)$$

where $\epsilon_n = o(\psi_n)$ is a positive sequence, i.e., $\lim_{n \rightarrow +\infty} \frac{\epsilon_n}{\psi_n} = 0$.

Step 2: Compute

$$y_n = P_{\mathcal{D}}(t_n - \tau \mathcal{S}(t_n)).$$

If $t_n = y_n$, then STOP and y_n is a solution. Otherwise, go to next step.

Step 3: Compute

$$u_{n+1} = P_{\mathcal{D}}(t_n - \tau \mathcal{S}(y_n)).$$

Set $n = n + 1$ and go back to **Step 1**.

3 Main results

To investigate the convergence analysis, it is considered that the following requirements are satisfied:

(S1) A solution set of problem (VIP) is denoted by Π and it is non-empty;

(S2) An operator $\mathcal{S} : \mathcal{X} \rightarrow \mathcal{X}$ is said to be pseudomonotone if

$$\langle \mathcal{S}(y_1), y_2 - y_1 \rangle \geq 0 \implies \langle \mathcal{S}(y_2), y_1 - y_2 \rangle \leq 0, \quad \forall y_1, y_2 \in \mathcal{D};$$

(S3) An operator $\mathcal{S} : \mathcal{X} \rightarrow \mathcal{X}$ is said to be *Lipschitz continuous* with constant $L > 0$ if there exists $L > 0$ such that

$$\|\mathcal{S}(y_1) - \mathcal{S}(y_2)\| \leq L\|y_1 - y_2\|, \quad \forall y_1, y_2 \in \mathcal{D};$$

(S4) An operator $\mathcal{S} : \mathcal{X} \rightarrow \mathcal{X}$ is said to be *sequentially weakly continuous* if $\{\mathcal{S}(u_n)\}$ converges weakly to $\mathcal{S}(u)$ for every sequence $\{u_n\}$ converges weakly to u .

The main algorithm is given the following form:

Lemma 3.1 Assume that $\mathcal{S} : \mathcal{X} \rightarrow \mathcal{X}$ satisfies the conditions (S1)–(S4). For a given $u^* \in \Pi \neq \emptyset$, we have

$$\|u_{n+1} - u^*\|^2 \leq \|t_n - u^*\|^2 - (1 - \tau L)\|t_n - y_n\|^2 - (1 - \tau L)\|u_{n+1} - y_n\|^2.$$

Proof First consider the following

$$\begin{aligned} \|u_{n+1} - u^*\|^2 &= \|P_{\mathcal{D}}[t_n - \tau \mathcal{S}(y_n)] - u^*\|^2 \\ &= \|P_{\mathcal{D}}[t_n - \tau \mathcal{S}(y_n)] + [t_n - \tau \mathcal{S}(y_n)] - [t_n - \tau \mathcal{S}(y_n)] - u^*\|^2 \\ &= \|[t_n - \tau \mathcal{S}(y_n)] - u^*\|^2 + \|P_{\mathcal{D}}[t_n - \tau \mathcal{S}(y_n)] - [t_n - \tau \mathcal{S}(y_n)]\|^2 \\ &\quad + 2\langle P_{\mathcal{D}}[t_n - \tau \mathcal{S}(y_n)] - [t_n - \tau \mathcal{S}(y_n)], [t_n - \tau \mathcal{S}(y_n)] - u^* \rangle. \end{aligned} \quad (3)$$

It is given that $u^* \in \Pi \subset \mathcal{D}$ such that

$$\begin{aligned} &\|P_{\mathcal{D}}[t_n - \tau \mathcal{S}(y_n)] - [t_n - \tau \mathcal{S}(y_n)]\|^2 \\ &\quad + \langle P_{\mathcal{D}}[t_n - \tau \mathcal{S}(y_n)] - [t_n - \tau \mathcal{S}(y_n)], [t_n - \tau \mathcal{S}(y_n)] - u^* \rangle \\ &= \langle [t_n - \tau \mathcal{S}(y_n)] - P_{\mathcal{D}}[t_n - \tau \mathcal{S}(y_n)], u^* - P_{\mathcal{D}}[t_n - \tau \mathcal{S}(y_n)] \rangle \leq 0, \end{aligned} \quad (4)$$

which implies that

$$\begin{aligned} & \langle P_{\mathcal{D}}[t_n - \tau \mathcal{S}(y_n)] - [t_n - \tau \mathcal{S}(y_n)], [t_n - \tau \mathcal{S}(y_n)] - u^* \rangle \\ & \leq -\|P_{\mathcal{D}}[t_n - \tau \mathcal{S}(y_n)] - [t_n - \tau \mathcal{S}(y_n)]\|^2. \end{aligned} \quad (5)$$

By the use of expressions (3) and (5), we obtain

$$\begin{aligned} \|u_{n+1} - u^*\|^2 & \leq \|t_n - \tau \mathcal{S}(y_n) - u^*\|^2 - \|P_{\mathcal{D}}[t_n - \tau \mathcal{S}(y_n)] - [t_n - \tau \mathcal{S}(y_n)]\|^2 \\ & \leq \|t_n - u^*\|^2 - \|t_n - u_{n+1}\|^2 + 2\tau \langle \mathcal{S}(y_n), u^* - u_{n+1} \rangle. \end{aligned} \quad (6)$$

By given that u^* is the solution of problem (VIP), we have

$$\langle \mathcal{S}(u^*), y - u^* \rangle \geq 0, \quad \text{for all } y \in \mathcal{D}.$$

Due to the pseudomonotonicity of $\mathcal{S}$ on $\mathcal{D}$, we get

$$\langle \mathcal{S}(y), y - u^* \rangle \geq 0, \quad \text{for all } y \in \mathcal{D}.$$

By substituting $y = y_n \in \mathcal{D}$, we get

$$\langle \mathcal{S}(y_n), y_n - u^* \rangle \geq 0.$$

Thus, we have

$$\langle \mathcal{S}(y_n), u^* - u_{n+1} \rangle = \langle \mathcal{S}(y_n), u^* - y_n \rangle + \langle \mathcal{S}(y_n), y_n - u_{n+1} \rangle \leq \langle \mathcal{S}(y_n), y_n - u_{n+1} \rangle. \quad (7)$$

By the use of expressions (6) and (7), we obtain

$$\begin{aligned} \|u_{n+1} - u^*\|^2 & \leq \|t_n - u^*\|^2 - \|t_n - u_{n+1}\|^2 + 2\tau \langle \mathcal{S}(y_n), y_n - u_{n+1} \rangle \\ & \leq \|t_n - u^*\|^2 - \|t_n - y_n + y_n - u_{n+1}\|^2 + 2\tau \langle \mathcal{S}(y_n), y_n - u_{n+1} \rangle \\ & \leq \|t_n - u^*\|^2 - \|t_n - y_n\|^2 - \|y_n - u_{n+1}\|^2 + 2\langle t_n - \tau \mathcal{S}(y_n) - y_n, u_{n+1} - y_n \rangle. \end{aligned} \quad (8)$$

It is given that $u_{n+1} = P_{\mathcal{D}}[t_n - \tau \mathcal{S}(y_n)]$, we have

$$\begin{aligned} & 2\langle t_n - \tau \mathcal{S}(y_n) - y_n, u_{n+1} - y_n \rangle \\ & = 2\langle t_n - \tau \mathcal{S}(t_n) - y_n, u_{n+1} - y_n \rangle + 2\tau \langle \mathcal{S}(t_n) - \mathcal{S}(y_n), u_{n+1} - y_n \rangle \\ & \leq 2\tau L \|t_n - y_n\| \|u_{n+1} - y_n\| \leq \tau L \|t_n - y_n\|^2 + \tau L \|u_{n+1} - y_n\|^2. \end{aligned} \quad (9)$$

Combining expressions (8) and (9), we obtain

$$\|u_{n+1} - u^*\|^2 \leq \|t_n - u^*\|^2 - (1 - \tau L) \|t_n - y_n\|^2 - (1 - \tau L) \|u_{n+1} - y_n\|^2. \quad (10)$$

□

Theorem 3.2 Let $\{u_n\}$ be a sequence generated by Algorithm 1 and satisfies the conditions (S1)-(S4). Moreover, choose $\{\psi_n\} \subset (0, 1)$ meet the conditions, i.e.,

$$\lim_{n \rightarrow +\infty} \psi_n = 0 \quad \text{and} \quad \sum_{n=1}^{+\infty} \psi_n = +\infty.$$

Then, $\{u_n\}$ strongly converges to $u^* \in \Pi$. Moreover, $P_{\Pi}(0) = u^*$.

Proof It is given in expression (2) that

$$\lim_{n \rightarrow +\infty} \frac{\alpha_n}{\psi_n} \|u_n - u_{n-1}\| \leq \lim_{n \rightarrow +\infty} \frac{\epsilon_n}{\psi_n} \|u_n - u_{n-1}\| = 0. \quad (11)$$

By the use of definition of $\{t_n\}$ and inequality (11), we obtain

$$\begin{aligned} \|t_n - u^*\| &= \|u_n + \alpha_n(u_n - u_{n-1}) - \psi_n u_n - \alpha_n \psi_n(u_n - u_{n-1}) - u^*\| \\ &= \|(1 - \psi_n)(u_n - u^*) + (1 - \psi_n)\alpha_n(u_n - u_{n-1}) - \psi_n u^*\| \end{aligned} \quad (12)$$

$$\begin{aligned} &\leq (1 - \psi_n)\|u_n - u^*\| + (1 - \psi_n)\alpha_n\|u_n - u_{n-1}\| + \psi_n\|u^*\| \\ &\leq (1 - \psi_n)\|u_n - u^*\| + \psi_n M_1, \end{aligned} \quad (13)$$

where

$$(1 - \psi_n) \frac{\alpha_n}{\psi_n} \|u_n - u_{n-1}\| + \|u^*\| \leq M_1.$$

By the use of Lemma 3.1, we obtain

$$\|u_{n+1} - u^*\|^2 \leq \|t_n - u^*\|^2, \quad \forall n \in \mathbb{N}. \quad (14)$$

Combining (13) with (14), we obtain

$$\begin{aligned} \|u_{n+1} - u^*\| &\leq (1 - \psi_n)\|u_n - u^*\| + \psi_n M_1 \\ &\leq \max\{\|u_n - u^*\|, M_1\} \\ &\vdots \\ &\leq \max\{\|u_0 - u^*\|, M_1\}. \end{aligned} \quad (15)$$

Thus, we conclude that the $\{u_n\}$ is bounded sequence. Indeed, by (13) we have

$$\begin{aligned} \|t_n - u^*\|^2 &\leq (1 - \psi_n)^2 \|u_n - u^*\|^2 + \psi_n^2 M_1^2 + 2M_1 \psi_n (1 - \psi_n) \|u_n - u^*\| \\ &\leq \|u_n - u^*\|^2 + \psi_n [\psi_n M_1^2 + 2M_1 (1 - \psi_n) \|u_n - u^*\|] \\ &\leq \|u_n - u^*\|^2 + \psi_n M_2, \end{aligned} \quad (16)$$

for some $M_2 > 0$. Combining the expressions (10) with (16), we have

$$\begin{aligned} \|u_{n+1} - u^*\|^2 &\leq \|u_n - u^*\|^2 + \psi_n M_2 \\ &\quad - (1 - \tau L) \|t_n - y_n\|^2 - (1 - \tau L) \|u_{n+1} - y_n\|^2. \end{aligned} \quad (17)$$

Due to the Lipschitz-continuity and pseudomonotonicity of $\mathcal{S}$ implies that the solution set Π is a closed and convex set. It is given that $u^* = P_\Pi(0)$ and using Lemma 2.1(ii), we have

$$\langle 0 - u^*, y - u^* \rangle \leq 0, \quad \forall y \in \Pi. \quad (18)$$

The remainder of the facts shall be split into the following two parts:

Case 1: Now consider that a fixed number $N_1 \in \mathbb{N}$ such that

$$\|u_{n+1} - u^*\| \leq \|u_n - u^*\|, \quad \forall n \geq N_1. \quad (19)$$

Thus, above implies that $\lim_{n \rightarrow +\infty} \|u_n - u^*\|$ exists and let $\lim_{n \rightarrow +\infty} \|u_n - u^*\| = l$, for some $l \geq 0$. From the expression (17), we have

$$\begin{aligned} &(1 - \tau L) \|t_n - y_n\|^2 + (1 - \tau L) \|u_{n+1} - y_n\|^2 \\ &\leq \|u_n - u^*\|^2 + \psi_n M_2 - \|u_{n+1} - u^*\|^2. \end{aligned} \quad (20)$$

Due to existence of a limit of sequence $\|u_n - u^*\|$ and $\psi_n \rightarrow 0$, we infer that

$$\|t_n - y_n\| \rightarrow 0 \quad \text{and} \quad \|u_{n+1} - y_n\| \rightarrow 0 \quad \text{as } n \rightarrow +\infty. \quad (21)$$

By the use of expression (21), we have

$$\lim_{n \rightarrow +\infty} \|t_n - u_{n+1}\| \leq \lim_{n \rightarrow +\infty} \|t_n - y_n\| + \lim_{n \rightarrow +\infty} \|y_n - u_{n+1}\| = 0. \quad (22)$$

Next, we will evaluate

$$\begin{aligned} \|t_n - u_n\| &= \|u_n + \alpha_n(u_n - u_{n-1}) - \psi_n[u_n + \alpha_n(u_n - u_{n-1})] - u_n\| \\ &\leq \alpha_n \|u_n - u_{n-1}\| + \psi_n \|u_n\| + \alpha_n \psi_n \|u_n - u_{n-1}\| \\ &= \psi_n \frac{\alpha_n}{\psi_n} \|u_n - u_{n-1}\| + \psi_n \|u_n\| + \psi_n^2 \frac{\alpha_n}{\psi_n} \|u_n - u_{n-1}\| \longrightarrow 0. \end{aligned} \quad (23)$$

The above provides that

$$\lim_{n \rightarrow +\infty} \|u_n - u_{n+1}\| \leq \lim_{n \rightarrow +\infty} \|u_n - t_n\| + \lim_{n \rightarrow +\infty} \|t_n - u_{n+1}\| = 0. \quad (24)$$

The above explanation guarantees that the sequences $\{t_n\}$ and $\{y_n\}$ are also bounded. By the use of reflexivity of $\mathcal{X}$ and the boundedness of $\{u_n\}$ guarantees that there exists a subsequence $\{u_{n_k}\}$ in order that $\{u_{n_k}\} \rightharpoonup \hat{u} \in \mathcal{X}$ as $k \rightarrow +\infty$. Next, we have to prove that $\hat{u} \in \Pi$. This is provided that $y_{n_k} = P_{\mathcal{D}}[t_{n_k} - \tau \mathcal{S}(t_{n_k})]$ that is equivalent to

$$\langle t_{n_k} - \tau \mathcal{S}(t_{n_k}) - y_{n_k}, y - y_{n_k} \rangle \leq 0, \quad \forall y \in \mathcal{D}. \quad (25)$$

The above inequality implies that

$$\langle t_{n_k} - y_{n_k}, y - y_{n_k} \rangle \leq \tau \langle \mathcal{S}(t_{n_k}), y - y_{n_k} \rangle, \quad \forall y \in \mathcal{D}. \quad (26)$$

Thus, we shall obtain

$$\frac{1}{\tau} \langle t_{n_k} - y_{n_k}, y - y_{n_k} \rangle + \langle \mathcal{S}(t_{n_k}), y_{n_k} - t_{n_k} \rangle \leq \langle \mathcal{S}(t_{n_k}), y - t_{n_k} \rangle, \quad \forall y \in \mathcal{D}. \quad (27)$$

Due to boundedness of the sequence $\{t_{n_k}\}$ implies that $\{\mathcal{S}(t_{n_k})\}$ is also bounded. By the use of $\lim_{k \rightarrow \infty} \|t_{n_k} - y_{n_k}\| = 0$ and $k \rightarrow \infty$ in (27), we obtain

$$\liminf_{k \rightarrow \infty} \langle \mathcal{S}(t_{n_k}), y - t_{n_k} \rangle \geq 0, \quad \forall y \in \mathcal{D}. \quad (28)$$

Moreover, we have

$$\begin{aligned} \langle \mathcal{S}(y_{n_k}), y - y_{n_k} \rangle &= \langle \mathcal{S}(y_{n_k}) - \mathcal{S}(t_{n_k}), y - t_{n_k} \rangle + \langle \mathcal{S}(t_{n_k}), y - t_{n_k} \rangle + \langle \mathcal{S}(y_{n_k}), t_{n_k} - y_{n_k} \rangle. \end{aligned} \quad (29)$$

Since $\lim_{k \rightarrow \infty} \|t_{n_k} - y_{n_k}\| = 0$ and $\mathcal{S}$ is L -Lipschitz continuous on $\mathcal{X}$ implies that

$$\lim_{k \rightarrow \infty} \|\mathcal{S}(t_{n_k}) - \mathcal{S}(y_{n_k})\| = 0. \quad (30)$$

which together with (29) and (30), we obtain

$$\liminf_{k \rightarrow \infty} \langle \mathcal{S}(y_{n_k}), y - y_{n_k} \rangle \geq 0, \quad \forall y \in \mathcal{D}. \quad (31)$$

Let consider a sequence of positive numbers $\{\epsilon_k\}$ that is decreasing and converge to zero. For each k , we denote m_k by the smallest positive integer such that

$$\langle \mathcal{S}(t_{n_i}), y - t_{n_i} \rangle + \epsilon_k \geq 0, \quad \forall i \geq m_k. \quad (32)$$

Due to $\{\epsilon_k\}$ is decreasing and $\{m_k\}$ is increasing.

Case I: If there is a $t_{n_{m_{k_j}}}$ subsequence of $t_{n_{m_k}}$ such that $\mathcal{S}(t_{n_{m_{k_j}}}) = 0$ ($\forall j$). Let $j \rightarrow \infty$, we obtain

$$\langle \mathcal{S}(\hat{u}), y - \hat{u} \rangle = \lim_{j \rightarrow \infty} \langle \mathcal{S}(t_{n_{m_{k_j}}}), y - \hat{u} \rangle = 0. \quad (33)$$

Hence $\hat{u} \in \mathcal{D}$, therefore we obtain $\hat{u} \in \Pi$.

Case II: If there exists $N_0 \in \mathbb{N}$ such that for all $n_{m_k} \geq N_0$, $\mathcal{S}(t_{n_{m_k}}) \neq 0$. Consider that

$$\Xi_{n_{m_k}} = \frac{\mathcal{S}(t_{n_{m_k}})}{\|\mathcal{S}(t_{n_{m_k}})\|^2}, \quad \forall n_{m_k} \geq N_0. \quad (34)$$

Due to the above definition, we obtain

$$\langle \mathcal{S}(t_{n_{m_k}}), \Xi_{n_{m_k}} \rangle = 1, \quad \forall n_{m_k} \geq N_0. \quad (35)$$

Moreover, expressions (32) and (35), for all $n_{m_k} \geq N_0$, we have

$$\langle \mathcal{S}(t_{n_{m_k}}), y + \epsilon_k \Xi_{n_{m_k}} - t_{n_{m_k}} \rangle \geq 0. \quad (36)$$

Due to the pseudomonotonicity of $\mathcal{S}$ for $n_{m_k} \geq N_0$,

$$\langle \mathcal{S}(y + \epsilon_k \Xi_{n_{m_k}}), y + \epsilon_k \Xi_{n_{m_k}} - t_{n_{m_k}} \rangle \geq 0. \quad (37)$$

For all $n_{m_k} \geq N_0$, we have

$$\langle \mathcal{S}(y), y - t_{n_{m_k}} \rangle \geq \langle \mathcal{S}(y) - \mathcal{S}(y + \epsilon_k \Xi_{n_{m_k}}), y + \epsilon_k \Xi_{n_{m_k}} - t_{n_{m_k}} \rangle - \epsilon_k \langle \mathcal{S}(y), \Xi_{n_{m_k}} \rangle. \quad (38)$$

Due to $\{t_{n_k}\}$ weakly converges to $\hat{u} \in \mathcal{D}$ through $\mathcal{S}$ is sequentially weakly continuous on the set $\mathcal{D}$, we get $\{\mathcal{S}(t_{n_k})\}$ weakly converges to $\mathcal{S}(\hat{u})$. Suppose that $\mathcal{S}(\hat{u}) \neq 0$, we have

$$\|\mathcal{S}(\hat{u})\| \leq \liminf_{k \rightarrow \infty} \|\mathcal{S}(t_{n_k})\|. \quad (39)$$

Since $\{t_{n_{m_k}}\} \subset \{t_{n_k}\}$ and $\lim_{k \rightarrow \infty} \epsilon_k = 0$, we have

$$0 \leq \lim_{k \rightarrow \infty} \|\epsilon_k \Xi_{n_{m_k}}\| = \lim_{k \rightarrow \infty} \frac{\epsilon_k}{\|\mathcal{S}(t_{n_{m_k}})\|} \leq \frac{0}{\|\mathcal{S}(\hat{u})\|} = 0. \quad (40)$$

Next, consider $k \rightarrow \infty$ in (38), we obtain

$$\langle \mathcal{S}(y), y - \hat{u} \rangle \geq 0, \quad \forall y \in \mathcal{D}. \quad (41)$$

By the use of Minty Lemma 2.5, we infer $\hat{u} \in \Pi$. Next, we have

$$\limsup_{n \rightarrow +\infty} \langle u^*, u^* - u_n \rangle = \lim_{k \rightarrow +\infty} \langle u^*, u^* - u_{n_k} \rangle = \langle u^*, u^* - \hat{u} \rangle \leq 0. \quad (42)$$

By the use of $\lim_{n \rightarrow +\infty} \|u_{n+1} - u_n\| = 0$. Therefore, (42) implies that

$$\begin{aligned} & \limsup_{n \rightarrow +\infty} \langle u^*, u^* - u_{n+1} \rangle \\ & \leq \limsup_{n \rightarrow +\infty} \langle u^*, u^* - u_n \rangle + \limsup_{n \rightarrow +\infty} \langle u^*, u_n - u_{n+1} \rangle \leq 0. \end{aligned} \quad (43)$$

Consider the expression (12), we have

$$\begin{aligned} & \|t_n - u^*\|^2 \\ & = \|u_n + \alpha_n(u_n - u_{n-1}) - \psi_n u_n - \alpha_n \psi_n(u_n - u_{n-1}) - u^*\|^2 \\ & = \|(1 - \psi_n)(u_n - u^*) + (1 - \psi_n)\alpha_n(u_n - u_{n-1}) - \psi_n u^*\|^2 \\ & \leq \|(1 - \psi_n)(u_n - u^*) + (1 - \psi_n)\alpha_n(u_n - u_{n-1})\|^2 + 2\psi_n \langle -u^*, t_n - u^* \rangle \\ & = (1 - \psi_n)^2 \|u_n - u^*\|^2 + (1 - \psi_n)^2 \alpha_n^2 \|u_n - u_{n-1}\|^2 \\ & \quad + 2\alpha_n(1 - \psi_n)^2 \|u_n - u^*\| \|u_n - u_{n-1}\| + 2\psi_n \langle -u^*, t_n - u_{n+1} \rangle + 2\psi_n \langle -u^*, u_{n+1} - u^* \rangle \\ & \leq (1 - \psi_n) \|u_n - u^*\|^2 + \alpha_n^2 \|u_n - u_{n-1}\|^2 + 2\alpha_n(1 - \psi_n) \|u_n - u^*\| \|u_n - u_{n-1}\| \\ & \quad + 2\psi_n \|u^*\| \|t_n - u_{n+1}\| + 2\psi_n \langle -u^*, u_{n+1} - u^* \rangle \end{aligned}$$

$$= (1 - \psi_n) \|u_n - u^*\|^2 + \psi_n \left[\alpha_n \|u_n - u_{n-1}\| \frac{\alpha_n}{\psi_n} \|u_n - u_{n-1}\| \right. \\ \left. + 2(1 - \psi_n) \|u_n - u^*\| \frac{\alpha_n}{\psi_n} \|u_n - u_{n-1}\| + 2\|u^*\| \|t_n - u_{n+1}\| + 2\langle u^*, u^* - u_{n+1} \rangle \right]. \quad (44)$$

From expressions (14) and (44), we obtain

$$\|u_{n+1} - u^*\|^2 \\ \leq (1 - \psi_n) \|u_n - u^*\|^2 + \psi_n \left[\alpha_n \|u_n - u_{n-1}\| \frac{\alpha_n}{\psi_n} \|u_n - u_{n-1}\| \right. \\ \left. + 2(1 - \psi_n) \|u_n - u^*\| \frac{\alpha_n}{\psi_n} \|u_n - u_{n-1}\| + 2\|u^*\| \|t_n - u_{n+1}\| + 2\langle u^*, u^* - u_{n+1} \rangle \right]. \quad (45)$$

By the use of (22), (43), (45) and applying Lemma 2.2, conclude that $\lim_{n \rightarrow +\infty} \|u_n - u^*\| = 0$.

Case 2: Suppose there is one $\{n_i\}$ subsequence of $\{n\}$ such that

$$\|u_{n_i} - u^*\| \leq \|u_{n_{i+1}} - u^*\|, \quad \forall i \in \mathbb{N}.$$

Using Lemma 2.3, there exists a sequence $\{m_k\} \subset \mathbb{N}$ as $\{m_k\} \rightarrow +\infty$ such that

$$\|u_{m_k} - u^*\| \leq \|u_{m_{k+1}} - u^*\| \quad \text{and} \quad \|u_k - u^*\| \leq \|u_{m_{k+1}} - u^*\|, \quad \text{for all } k \in \mathbb{N}. \quad (46)$$

As in Case 1, the relation (20) gives that

$$(1 - \tau L) \|t_{m_k} - y_{m_k}\|^2 + (1 - \tau L) \|u_{m_{k+1}} - y_{m_k}\|^2 \\ \leq \|u_{m_k} - u^*\|^2 + \psi_{m_k} M_2 - \|u_{m_{k+1}} - u^*\|^2. \quad (47)$$

Due to $\psi_{m_k} \rightarrow 0$, we deduce the following:

$$\lim_{k \rightarrow +\infty} \|t_{m_k} - y_{m_k}\| = \lim_{k \rightarrow +\infty} \|u_{m_{k+1}} - y_{m_k}\| = 0. \quad (48)$$

It follows that

$$\lim_{k \rightarrow +\infty} \|u_{m_{k+1}} - t_{m_k}\| \leq \lim_{k \rightarrow +\infty} \|u_{m_{k+1}} - y_{m_k}\| + \lim_{k \rightarrow +\infty} \|y_{m_k} - t_{m_k}\| = 0. \quad (49)$$

Next, evaluate

$$\|t_{m_k} - u_{m_k}\| = \|u_{m_k} + \alpha_{m_k}(u_{m_k} - u_{m_{k-1}}) - \psi_{m_k}[u_{m_k} + \alpha_{m_k}(u_{m_k} - u_{m_{k-1}})] - u_{m_k}\| \\ \leq \alpha_{m_k} \|u_{m_k} - u_{m_{k-1}}\| + \psi_{m_k} \|u_{m_k}\| + \alpha_{m_k} \psi_{m_k} \|u_{m_k} - u_{m_{k-1}}\| \\ = \psi_{m_k} \frac{\alpha_{m_k}}{\psi_{m_k}} \|u_{m_k} - u_{m_{k-1}}\| + \psi_{m_k} \|u_{m_k}\| + \psi_{m_k}^2 \frac{\alpha_{m_k}}{\psi_{m_k}} \|u_{m_k} - u_{m_{k-1}}\| \longrightarrow 0. \quad (50)$$

This follows that

$$\lim_{k \rightarrow +\infty} \|u_{m_k} - u_{m_{k+1}}\| \leq \lim_{k \rightarrow +\infty} \|u_{m_k} - t_{m_k}\| + \lim_{k \rightarrow +\infty} \|t_{m_k} - u_{m_{k+1}}\| = 0. \quad (51)$$

Using the same explanation as in the Case 1, such that

$$\limsup_{k \rightarrow +\infty} \langle u^*, u^* - u_{m_{k+1}} \rangle \leq 0. \quad (52)$$

Using the expressions (45) and (46), we get

$$\|u_{m_{k+1}} - u^*\|^2 \\ \leq (1 - \psi_{m_k}) \|u_{m_k} - u^*\|^2 + \psi_{m_k} \left[\alpha_{m_k} \|u_{m_k} - u_{m_{k-1}}\| \frac{\alpha_{m_k}}{\psi_{m_k}} \|u_{m_k} - u_{m_{k-1}}\| \right. \\ \left. + 2(1 - \psi_{m_k}) \|u_{m_k} - u^*\| \frac{\alpha_{m_k}}{\psi_{m_k}} \|u_{m_k} - u_{m_{k-1}}\| + 2\|u^*\| \|t_{m_k} - u_{m_{k+1}}\| + 2\langle u^*, u^* - u_{m_{k+1}} \rangle \right]$$

$$\begin{aligned} &\leq (1 - \psi_{m_k}) \|u_{m_k+1} - u^*\|^2 + \psi_{m_k} \left[\alpha_{m_k} \|u_{m_k} - u_{m_k-1}\| \frac{\alpha_{m_k}}{\psi_{m_k}} \|u_{m_k} - u_{m_k-1}\| \right. \\ &\quad \left. + 2(1 - \psi_{m_k}) \|u_{m_k} - u^*\| \frac{\alpha_{m_k}}{\psi_{m_k}} \|u_{m_k} - u_{m_k-1}\| + 2\|u^*\| \|t_{m_k} - u_{m_k+1}\| + 2\langle u^*, u^* - u_{m_k+1} \rangle \right]. \end{aligned} \quad (53)$$

Thus, above implies that

$$\begin{aligned} &\|u_{m_k+1} - u^*\|^2 \\ &\leq \left[\alpha_{m_k} \|u_{m_k} - u_{m_k-1}\| \frac{\alpha_{m_k}}{\psi_{m_k}} \|u_{m_k} - u_{m_k-1}\| \right. \\ &\quad \left. + 2(1 - \psi_{m_k}) \|u_{m_k} - u^*\| \frac{\alpha_{m_k}}{\psi_{m_k}} \|u_{m_k} - u_{m_k-1}\| + 2\|u^*\| \|t_{m_k} - u_{m_k+1}\| + 2\langle u^*, u^* - u_{m_k+1} \rangle \right]. \end{aligned} \quad (54)$$

Since $\psi_{m_k} \rightarrow 0$, and $\|u_{m_k} - u^*\|$ is a bounded. Therefore, expressions (52) and (54) implies that

$$\|u_{m_k+1} - u^*\|^2 \rightarrow 0, \quad \text{as } k \rightarrow +\infty. \quad (55)$$

This means that

$$\lim_{n \rightarrow +\infty} \|u_k - u^*\|^2 \leq \lim_{n \rightarrow +\infty} \|u_{m_k+1} - u^*\|^2 \leq 0. \quad (56)$$

As a consequence $u_n \rightarrow u^*$. This is going to conclude the proof of the theorem. $\square$

The second projection in Algorithm 1 is substituted with half-space to minimize computing cost, as inspired by Algorithm 4.1 in the paper [4]. The second main algorithm is written as follows:

Algorithm 2 (Inertial Strongly Convergent Iterative Method)

Step 0: Select $u_0, u_1 \in \mathcal{D}$, $\alpha > 0$ and $0 < \tau < \frac{1}{L}$. Moreover, choose $\{\psi_n\} \subset (0, 1)$ fulfills the following criteria: $\lim_{n \rightarrow +\infty} \psi_n = 0$ and $\sum_{n=1}^{+\infty} \psi_n = +\infty$.

Step 1: Compute

$$t_n = u_n + \alpha_n(u_n - u_{n-1}) - \psi_n[u_n + \alpha_n(u_n - u_{n-1})],$$

where α_n such that

$$0 \leq \alpha_n \leq \hat{\alpha}_n \quad \text{and} \quad \hat{\alpha}_n = \begin{cases} \min \left\{ \frac{\alpha}{2}, \frac{\epsilon_n}{\|u_n - u_{n-1}\|} \right\} & \text{if } u_n \neq u_{n-1}, \\ \frac{\alpha}{2} & \text{else,} \end{cases}$$

where $\epsilon_n = o(\psi_n)$ is a positive sequence, i.e., $\lim_{n \rightarrow +\infty} \frac{\epsilon_n}{\psi_n} = 0$.

Step 2: Compute

$$y_n = P_{\mathcal{D}}(t_n - \tau \mathcal{S}(t_n)).$$

If $t_n = y_n$, then STOP and y_n is a solution.

Step 3: Compute

$$u_{n+1} = P_{\mathcal{X}_n}(t_n - \tau \mathcal{S}(y_n)),$$

where $\mathcal{X}_n = \{z \in \mathcal{X} : \langle t_n - \tau \mathcal{S}(t_n) - y_n, z - y_n \rangle \leq 0\}$. Set $n = n + 1$ and go back to **Step 1**.

4 Numerical illustrations

This section discusses two numerical tests to explain the efficacy of the proposed algorithms. All these numerical studies give a detailed understanding of how better control parameters can be chosen. Each of them shows the advantages of the proposed methods relative to the existing ones in the literature.

Example 4.1 First consider the HpHard problem which is taken from [7]. This example has been considered by many people for experimental test (see, [5, 8, 21]). A operator $\mathcal{S} : \mathbb{R}^m \rightarrow \mathbb{R}^m$ is defined by

$$\mathcal{S}(u) = Mu + q$$

Fig. 1 Numerical illustration of Algorithm 1 with Algorithm 1 in [16] and Algorithm 3.1 in [1] and Algorithm 3.1 in [27] while $m = 5$

Fig. 2 Numerical illustration of Algorithm 1 with Algorithm 1 in [16] and Algorithm 3.1 in [1] and Algorithm 3.1 in [27] while $m = 10$

with $q \in \mathbb{R}^m$ and

$$M = NN^T + B + D.$$

In above definition, we take $N = \text{rand}(m)$ to be a random matrix and $B = 0.5K - 0.5K^T$ to be a skew-symmetric matrix with $K = \text{rand}(m)$ and $D = \text{diag}(\text{rand}(m, 1))$ is a diagonal matrix. The set $\mathcal{D}$ is taken as follows:

$$\mathcal{D} = \{u \in \mathbb{R}^m : Qu \leq b\},$$

where $Q = \text{rand}(100, m)$ and $b = \text{rand}(100, 1)$. It is obvious that $\mathcal{S}$ is monotone and that Lipschitz is continuous by $L = \|M\|$. The starting point for this experiment are $u_0 = u_1 = (1, 1, \dots, 1)$. The numerical consequences of these methods are seen in Figs. 1, 2, 3 and 4 and Tables 1 and 8. The control requirement shall be taken as follows:

- (1) Algorithm 1 in [16] (shortly, **Algorithm A**): $\tau = \frac{0.7}{L}$, $D_n = \|u_n - y_n\| \leq 10^{-4}$;
- (2) Algorithm 3.1 in [1] (shortly, **Algorithm B**): $\alpha = 0.60$, $\tau = \frac{0.7}{L}$, $\epsilon_n = \frac{1}{(n+1)^2}$, $\psi_n = \frac{1}{(n+2)}$, $\theta_n = \frac{5}{10}(1 - \psi_n)$, $D_n = \|t_n - y_n\| \leq 10^{-4}$;

Fig. 3 Numerical illustration of Algorithm 1 with Algorithm 1 in [16] and Algorithm 3.1 in [1] and Algorithm 3.1 in [27] while $m = 20$

Fig. 4 Numerical illustration of Algorithm 1 with Algorithm 1 in [16] and Algorithm 3.1 in [1] and Algorithm 3.1 in [27] while $m = 30$

(3) Algorithm 3.1 in [27] (shortly, **Algorithm C**): $\alpha = 0.60$, $\tau = \frac{0.7}{L}$, $\psi_n = \frac{1}{(n+2)}$, $\epsilon_n = \frac{1}{(n+1)^2}$, $f(u) = \frac{u}{3}$, $D_n = \|t_n - y_n\| \leq 10^{-4}$;

(4) Algorithm 1 (shortly, **Algorithm D**): $\tau = \frac{0.7}{L}$, $\alpha = 0.60$, $\epsilon_n = \frac{1}{(n+1)^2}$, $\psi_n = \frac{1}{(n+2)}$, $D_n = \|t_n - y_n\| \leq 10^{-4}$ (Table 2).

Example 4.2 Consider the non-linear complementarity problem of Kojima–Shindo where the operator $S : \mathbb{R}^4 \rightarrow \mathbb{R}^4$ is described by

$$S(u) = \begin{pmatrix} u_1 + u_2 + u_3 + u_4 - 4u_2u_3u_4 \\ u_1 + u_2 + u_3 + u_4 - 4u_1u_3u_4 \\ u_1 + u_2 + u_3 + u_4 - 4u_1u_2u_4 \\ u_1 + u_2 + u_3 + u_4 - 4u_1u_2u_3 \end{pmatrix}.$$

Moreover, the feasible set $\mathcal{D}$ is defined by

$$\mathcal{D} = \{u \in \mathbb{R}^4 : 1 \leq u_i \leq 5, i = 1, 2, 3, 4\}.$$

It is clear to see that $\mathcal{S}$ is not monotone on the set $\mathcal{D}$. By the use of Monte-Carlo technique [9], it can be shown that $\mathcal{S}$ is pseudo-monotone on $\mathcal{D}$. There exists a unique solution $u^* = (5, 5, 5, 5)^T$ for given problem. The starting point for this experiment are $u_0 = u_1 = (1, 1, \dots, 1)$ and $D_n = \|t_n - y_n\| \leq 10^{-3}$. The numerical consequences of these methods are seen in Tables 3, 4, 5 and 6. The control requirement shall be taken as follows: (1) Algorithm 1 in [16] (shortly, **Algorithm A**): $\tau = \frac{0.7}{L}$, $D_n = \|u_n - y_n\| \leq 10^{-4}$;

(2) Algorithm 3.1 in [1] (shortly, **Algorithm B**): $\alpha = 0.60$, $\tau = \frac{0.7}{L}$, $\epsilon_n = \frac{1}{(n+1)^2}$, $\psi_n = \frac{1}{(n+2)}$, $\theta_n = \frac{5}{10}(1 - \psi_n)$, $D_n = \|t_n - y_n\| \leq 10^{-4}$;

(3) Algorithm 3.1 in [27] (shortly, **Algorithm C**): $\alpha = 0.60$, $\tau = \frac{0.7}{L}$, $\psi_n = \frac{1}{(n+2)}$, $\epsilon_n = \frac{1}{(n+1)^2}$, $f(u) = \frac{u}{3}$, $D_n = \|t_n - y_n\| \leq 10^{-4}$;

(4) Algorithm 1 (shortly, **Algorithm D**): $\tau = \frac{0.7}{L}$, $\alpha = 0.60$, $\epsilon_n = \frac{1}{(n+1)^2}$, $\psi_n = \frac{1}{(n+2)}$, $D_n = \|t_n - y_n\| \leq 10^{-4}$.

Example 4.3 Let $\mathcal{X} = l_2$ be a real Hilbert space with the sequences of real numbers satisfying the following condition

$$\|u_1\|^2 + \|u_2\|^2 + \cdots + \|u_n\|^2 + \cdots < +\infty. \quad (57)$$

Assume that a mapping $\mathcal{S} : \mathcal{D} \rightarrow \mathcal{D}$ is defined by

$$G(u) = (5 - \|u\|)u, \quad \forall u \in \mathcal{X},$$

where $\mathcal{D} = \{u \in \mathcal{X} : \|u\| \leq 3\}$. We can easily see that $\mathcal{S}$ is weakly sequentially continuous on $\mathcal{X}$ and the solution set is $VI(\mathcal{D}, \mathcal{S}) = \{0\}$. Moreover, $\mathcal{S}$ is L -Lipschitz continuous with $L = 11$. The mapping $\mathcal{S}$ is pseudomonotone on $\mathcal{D}$ but not monotone (see for more details [33]). Let considered the following projection
