### **Abstract**

When technology and innovation play a significant role in today's Thai education which is one of the measures and guides the nation's progress certain skills and scientific knowledge are the focus of special attention, and the Ministry of Education has issued a policy that unlocks and adapts to uncertain times. This academic article would like to present the educational approach and classroom of the future in Thailand. The Ministry of Education encourages classrooms that can be flexible both online and on-site in a blended learning model that incorporates blended learning, maybe as a result of the pandemic crisis. This is obvious from the rules and standards that are used to describe Thai education today, it is evident that the world places significant value on innovation and technology, making the past the primary component of the cause. Yet, given that Thailand is a country with a very diverse population, it will be challenging for students to obtain education that is not at the cutting edge of technological advancement if multiple digital media are introduced as a part of the learning process. Because of this, there is still inequality in some areas of the Thai educational system during these uncertain times, despite the use of cutting-edge technology.

**Keywords:** Thai Education System; Future Classroom Direction; Uncertain Time
